1 Introduction

A major contributing factor in the success of USB as a peripheral interface has been the close adherence to the specification and the testing program that ensures USB interoperability. This technical note describes some of the USB testing that is required and what the different USB symbols mean.
2 USB Compliance Testing

The USB standard defines a suite of compliance tests that must be passed before a device can claim to be USB compliant. A product designed with a compliant chipset does not automatically make the end product compliant with the USB specification. The end product must also pass the USB compliance tests before it can claim to be USB compliant. The tests are broadly split into two parts, electrical and interoperability (software).

There are test companies which will test products and services for OEMs, but another alternative is to visit a USB Implementers Forum “plugfest”. These are workshops held by the governing body at regular intervals throughout the world where you can have your device tested and ratified for free provided the OEM is a member of the USB Implementers Forum in good standing.

There are also free test kits available from the USB Implementers Forum to allow you to perform some of these tests before submitting your product for test.

For more details see www.usb.org

2.1 Electrical Tests

2.1.1 Signal quality
The signal quality is a measure of the signal rise and fall times and peak levels. This is usually measured on an oscilloscope against a template known as an "eye" diagram where the signal must remain within the upper and lower limits.

2.1.2 Power
The power consumption of the device is verified in all power modes of the device e.g. during enumeration, in suspend or when active. It also looks at the in rush current on plug in and exiting suspend.

2.2 Interoperability

Interoperability is concerned with the device descriptors and device configuration being correct and not interfering with other devices that may be plugged in to a host at the same time. (See TN_113 Simplified Description of USB Enumeration for more information)
3 Product Labelling

There are two main USB symbols in common use. The USB Trident symbol and the USB logo.

3.1 Trident Symbol

The trident symbol is most commonly seen on USB connectors. It indicates the device is compatible with USB. Any USB compatible device may use the trident symbol. It does not signify the device has passed the USB compliance tests.

Figure 3.1: The USB Trident Symbol

3.2 USB Logo

The USB Logo may only be used under the following conditions:

1) The OEM has obtained a current Vendor ID (VID) from the USB Implementers Forum through membership or purchase.
2) The device has passed all USB compliance tests.
3) The OEM has executed a logo license agreement with the USB Implementers Forum.

Official USB logos are provided to the OEM after execution of the license agreement. Examples from the USB-IF web site are shown here:

Figure 3.2: USB Logo Examples

FTDI is not authorized to extend use of the USB logos under any circumstances. Also note that OEMs who have obtained a block of Product IDs for use with the FTDI Vendor ID cannot use the USB logos under any circumstances. See Technical Note TN 100 USB Vendor / Product ID Guidelines for further details.
4 FTDI Devices

FTDI devices are all tested against the USB compliance tests. The devices have passed these tests as “Silicon Building Blocks” and are compliant to the USB specification.
