The intention of this errata technical note is to give a detailed description of known functional or electrical issues with the FTDI FT220X devices. The current revision of the FT220X is revision D, released November 2012.

1 FT220X Revision

FT220X part numbers are listed in Table 1. The letter at the end of date code identifies the device revision.

The current revision of the FT220X is revision D, released November 2012. At the time of releasing this Technical Note there are no known issues with this silicon revision.

3 Functional Problems of FT220X

3.1 Revision A

3.1.1 USB Data Transfer

Introduction:

An issue has been identified where the transfer of data over USB stops unexpectedly.

Problem:

The device is put into suspend mode during a transfer of certain data patterns most notable with binary zeros. This can halt the data transfer in certain circumstances and will require the device to be re-enumerated to recover.

NB. It is the presence of this data pattern on the USB bus regardless of whether the data is intended for the FT220X or other devices (e.g. a broadcast) on the bus that forces the suspend state.

Workaround:

This issue can be avoided by utilising the keep awake function of the chip. This will disable the USB suspend function of the chip and is therefore an intermediate workaround until revision D silicon is released with a permanent fix.

NB. With the workaround the chip will never enter lower powered suspend. However the keep awake current will be approximately 3mA.

To enable the keep awake function in the EEPROM, one of the CBUS pins needs to be configured as Keep-Awake#. This pin then needs to be tied to ground on the PCB. The FT_Prog utility can be used to configure the CBUS pin.

Package specific:

The effected packages are listed in Table 5.

Table 5
### 3.1.2 USB 3.0 Hosts

**Introduction:**

An issue has been identified where the FT220X will not enumerate when connected to certain USB 3.0 Hosts. So far FTDI have identified **ONE** such host.

**Problem:**

Certain USB 3.0 Hosts exhibit reduced reset recovery times after a USB reset, which can at times be faster or close to the USB 2.0 specification limit. The USB 2.0 specification states a USB reset recovery time of 10ms and in general almost all hosts allocate a much longer period than this. The FT220X device may not enumerate if the reset recovery time is reduced.

This issue has been seen on one USB 3.0 Host controller and has not been seen on a USB 2.0 Host controller or other USB 3.0 Host controllers.

**Workaround:**

Reconnect the device to a USB 2.0 host. This issue has been seen only on one particular USB 3.0 Host controllers.

**Package specific:**

The effected packages are listed in Table 6.

4.1 Revision A
No known issues at revision A

4.2 Revision B

4.2.1 Internal 3V3 Regulator

Introduction:
The FT220X uses an internal regulator to generate 3V3 from a 5V source (VCC). The source should be variable from 3V3 to 5V.

Problem:
The VCC supply to the regulator must not drop below 4.3V for the correct 3V3 regulated output to be produced.

Workaround:
VCC must not be supplied below 4.3V.

Package specific:
The effected packages are listed in Table 11.

5 FT220X Package Markings

FT220X is available in a RoHS Compliant RoHS Compliant package, 16 pin QFN and 16 pin SSOP. An example of the markings on the package is shown in Figure 5.1.

![Figure 5-1 Package Markings – FT220XQ](image)

The date code format is **YYWW** where **WW** = 2 digit week number, **YY** = 2 digit year number. This is followed by the revision number.

The code **XXXXXXXXXXXX** is the manufacturing LOT code.
