This document shows how to communicate with multiple SPI slaves when utilizing an FT4222H.

Use of FTDI devices in life support and/or safety applications is entirely at the user’s risk, and the user agrees to defend, indemnify and hold FTDI harmless from any and all damages, claims, suits or expense resulting from such use.

1 Introduction

The FT4222H is a High/Full Speed USB2.0-to-Quad SPI/I2C device controller, it contains SPI/ I2C configurable interfaces. The SPI interface can be configured in master mode with single, dual, or quad bits data width transfer or in slave mode with single bit data width transfer.

FT4222H supports 4 operation modes to allow various I2C/SPI devices to be connected to USB bus. The attachable device configuration for each mode is listed below:

- Mode 0 (2 USB interfaces):
  - 1 SPI master, SPI slave, I 2C master, or I 2C slave device
  - 1 GPIO device
- Mode 1 (4 USB interfaces):
  - SPI master connects to 3 SPI slave devices
  - 1 GPIO device
- Mode 2 (4 USB interfaces):
  - SPI master connects to 4 SPI slave devices
- Mode 3 (1 USB interface):
  - 1 SPI master, SPI slave, I 2C master, or I 2C slave device

This document will show when FT4222H is working in mode 2 or mode 3, how the SPI master can communicate with multiple SPI slave devices.
2 Getting Started

A LibFT4222 application usually starts with FT_CreateDeviceInfoList and FT_GetDeviceInfoList much the same as a traditional D2XX application would. Under different chip modes, FT_CreateDeviceInfoList will report a different number of interfaces as shown in the table below.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Number of Interfaces</th>
<th>Device Function</th>
</tr>
</thead>
</table>
| 0    | 2                    | a. The first interface: it can be one of SPI master, SPI slave, I 2C master, or I 2C slave device.  
|      |                      | b. The 2nd interface: GPIO device. |
| 1    | 4                    | a. The first 3 interfaces: SPI master connects to 3 SPI slaves.  
|      |                      | b. The 4th interface: GPIO device. |
| 2    | 4                    | a. SPI master connects to 4 SPI slaves, see Figure 2.1. |
| 3    | 1                    | a. It can be one of SPI master, SPI slave, I 2C master, or I 2C slave device. |

Table 2.1 Chip Mode and Device Functions

After opening the device with FT_Open or FT_OpenEx, developers need to initialize the FT4222H device as either SPI master, SPI slave, I 2C master, or I 2C slave. Different types of devices require different configurations.
Figure 2.1 shows the hardware connection when the FT4222H is configured in mode 2.
3  Example

LibFT4222 must be used to develop functions, which provide high-level APIs to facilitate user application development. At the time of writing support for Windows and Linux OS has been published. Android support uses a different package also available from the FTDI website.
