1 Introduction

1.1 The DB9-USB Family of UART Converter Modules

The DB9-USB connector modules can be used to upgrade an RS232 port to an active USB port. In some cases, this can be done without the need to redesign the PCB. In some cases, they can reduce system costs by removing an RS232 level shifter from a design.

The DB9-USB family consist of 6 modules. Two of these operate at RS232 voltage levels – these can be used as a direct replacement in a system which uses RS232 levels, while four of them operate at digital voltage levels (a choice of 5V or 3.3V) – these can be used to interface to an application systems logic level which could result in the bill-of-materials being reduced by the removal of any RS232 level shifters which may be in the system. Each is available to replace either a male or a female DB9.

1.2 Functional Description

DB9-USB modules can be used to upgrade a UART port of a device to an active USB port. These active connectors contain all the USB to UART (and vice-versa) conversion electronics and are designed to fit directly into the same PCB footprint as a PC compatible UART DB9 connector.

The FTDI DB9-USB RS232 level modules are available in two types DB9-USB-M and DB9-USB-F. Using these modules does not require any changes to a PCB or enclosure.

A DB9-USB-M can be used to replace a male DB9 connector that is wired in a PC compatible RS232 manner. This module operates at RS232 signal levels.

A DB9-USB-F can be used to replace a female DB9 connector that is wired in a PC compatible RS232 manner. This module operates at RS232 signal levels.

The FTDI DB9-USB 3.3V digital voltage level modules are available in two types DB9-USB-D3-M and DB9-USB-D3-F. Using these modules may require a minor change to the PCB but saves in material costs by removing the need for an RS232 level shifter.

A DB9-USB-D3-M can be used to replace a male DB9 connector that is wired in a PC compatible RS232 manner. This module operates at 3.3V signal levels.

A DB9-USB-D3-F can be used to replace a female DB9 connector that is wired in a PC compatible RS232 manner. This module operates at 3.3V signal levels.

The FTDI DB9-USB 5V digital voltage level modules are available in two types DB9-USB-D5-M and DB9-USB-D5-F. Using these modules may require a minor change to the PCB but saves in material costs by removing the need for an RS232 level shifter.

A DB9-USB-D5-M can be used to replace a male DB9 connector that is wired in a PC compatible RS232 manner. This module operates at 5.0V signal levels.

A DB9-USB-D5-F can be used to replace a female DB9 connector that is wired in a PC compatible RS232 manner. This module operates at 5.0V signal levels.

The purpose of these modules are to provide a simple method of adapting legacy serial devices with UART interfaces to modern USB ports by replacing the DB9 connector with this miniaturised module which closely resembles a DB9 connector. This is accomplished by incorporating the industry standard FTDI FT232RQ USB-Serial Bridge IC. The RS232 level DB9-USB modules include an RS232 level transceiver.
DB9-USB modules use a standard USB-MINI-B connector for connection to an upstream host or hub port.

**RS232 Level**: RS232 level signals, includes modem handshake signals, and capable of transmitting data at rates up to 1 Mega Baud.

**Digital Voltage Level**: 3.3V or 5V level signals, includes modem handshake signals, and capable of transmitting data at rates up to 3 Mega Baud.

DB9-USB modules require USB device drivers, available free from www.ftdichip.com, which are used to make DB9-USB modules appear as a Virtual COM Port (VCP). This allows existing serial communications software, such as HyperTerminal, to exchange data through the DB9-USB to a legacy UART peripheral device.

### 1.3 Background

In the long distant past, there was no standard defined for the connections on a DB9 connector when it was used as an RS232 interface. That changed when IBM introduced the PC-AT. This introduced a generally accepted DB9 RS232 standard and PC peripherals adopted the same pin-out using a 1-to-1 cable connection between the PC and the peripheral.

DB9-USB modules have adopted this standard. The DB9 connector wire schemes used by this module either the standard male or standard female wire configuration.

Note that **NOT ALL** peripheral adopted this standard so it is important for the user to check against the pin-out used for the male and female DB9-USB connectors.

**Note**: DB9 connectors are also known as DE9 connector since it consists of 9 pins in a size E shell. However, DE9 connectors are more commonly referred to as DB9 connector.

### 1.4 Block Diagrams

![DB9-USB RS232 Level Block Diagram](image)
1.4.1 Block Description

**USB Mini B Client Connector**

This connector provides the interface for connection to a USB Host or Hub port.

**FTDI FT232RQ**

The FTDI FT232RQ provides the USB-to-Serial conversion. Operating system device drivers are required in order to operate with the FT232RQ to provide the Virtual COM Port serial functionality.

**RS232 Level Shifter**

The RS232 level shifter converts the signals provided by the FT232RQ into the voltage levels required by application RS232 interface.

**DB9-USB PCB Footprint**

The DB9-USB pin-out is configured to match the industry standard DB9 footprint. See section 3.
1.5 Features

- Adds one USB serial port by connecting to the RS232 DB9 footprint of a device
- Easy placement for an standard Male and Female RS232 DB9 footprint of a device
- A selection of RS232, 3.3V or 5V UART signal levels.
- Works with USB 1.1 & 2.0 Host and Hub ports
- Industry Standard FTDI chip set & device drivers for maximum compatibility
- Microsoft Windows® WHQL-certified, Mac, Linux and Android drivers.
- Installs as a standard Windows COM port
- 128 bytes transmit buffer, 256 bytes receive buffer
- UART data signals: TxD, RxD, RTS, CTS, DSR, DTR, DCD, RI, GND
- Powered by USB port. No external power adapter required.
- Serial port speed up to 1Mbps (RS232 levels) or 3Mbps (3.3V/5V levels)
- Serial Communication Parameters
  - Parity: None, Even, Odd
  - Data bits: 7, 8
  - Flow control: RTS/CTS, DSR/DTR, X-ON/X-OFF, None
- Operating temperature of -40°C to +85°C

Table 1.2 – Ordering Information
1.7 Driver Support

Royalty free VIRTUAL COM PORT (VCP) and D2XX Direct Drivers are available for the following Operating Systems (OS):

- Windows
- Linux
- Mac
- Android (J2xx / D2xx only)

See the following website link for the full driver support list including OS versions and legacy OS.

https://ftdichip.com/drivers/

Virtual COM Port (VCP) drivers cause the USB device to appear as an additional COM port available to the PC. Application software can access the USB device in the same way as it would access a standard COM port.

D2XX Direct Drivers allow direct access to the USB device through a DLL. Application software can access the USB device through a series of DLL function calls. The functions available are listed in the D2XX Programmer’s Guide document which is available from the Documents section of our website.

Please also refer to the Installation Guides webpage for details on how to install the drivers.

**Table 2.1 – USB “mini-B” Receptacle Pin-Out**
3 UART Connections

The PC compatible accepted internal electrical connections for male and female UART DB9 connectors are illustrated in Figure 3.1 where the structure on the left is the top view of a male UART DB9 connector and the structure on the right is the top view of a female UART DB9 connector. A DTE transceiver is used in both modules, the male DB9 module has a null-modem connection between the transceiver and pins, and the female has a straight through connection between the transceiver and pins.

Assuming a design follows these connection conventions, then an FTDI male or female DB9-USB connector can be used to replace this UART DB9 connector to turn this port into an active USB interface.

![Figure 3.1 – Male & Female DB9-USB Internal Connections (Top View looking through the Module)](image)

The connection between a male and female DB9 module an application board is illustrated in Figure 3.2. It can be determined that a male DB9 connector can be replaced with a male DB9 module and a female connector can be replaced with a female module.

4 Installation

4.1 Device Driver Installation

The drivers for the DB9-USB modules are available for download from https://ftdichip.com/.

4.1.1 Microsoft Windows Installation

With the device drivers being Windows Hardware Quality Labs (WHQL) certified, they are also available through download directly from the Microsoft® Windows® Update service. Simply plug the device into the Windows PC and the drivers should load automatically if the PC is connected to the internet. Additional installation instructions can be found on the Installation Guides page of our website.

4.1.2 MacOS, Linux and Android

Device drivers and FTDI installation guides for Mac OS X, Linux and Android are available for download on the FTDI Chip website. Follow the respective FTDI Installation Guides for the chosen operating system.

8 Environmental Approvals & Declarations

8.1 EMI Compatibility

FCC, CE and UKCA
DB9-USB modules are certified for both FCC Part 15 Subpart B, European EMC Directive and UKCA.

Note: This is a Class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

Note: This equipment is currently undergoing testing to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

8.2 Safety

The DB9-USB modules are defined as Limited Power Supply (LPS) device, with operating voltages under 60VDC.

8.3 Environmental

The DB9-USB modules are lead-free devices that comply with the following environmental directives: RoHS, WEEE, REACH, PFOS and DecaBDE.

8.4 Reliability

The DB9-USB modules are designed to be a robust USB-Serial module for use in many environments. There are no user-serviceable parts. Any failure will require a replacement of the unit.

9 Troubleshooting

Ensure the latest device driver is in use. See https://ftdichip.com/.

If USB devices other than FTDI chips are installed in the system, then check with all manufacturers of these devices for the latest device drivers.

Section 4 details driver installation. If the user continues to have driver installation issues, then please refer to the FTDI Installation Guides for additional details.

Common Windows Device Driver Troubles:

- **DEVICE TIMES OUT**: The default settings of the device driver assume typical data transfers of hundreds to thousands or more bytes at a given time. Some applications, such as a GPS device, only send data in short packets, often only a few bytes. If this is the case, it may be necessary to adjust the driver buffer size and/or latency timer to smaller values. These values can be adjusted through the advanced driver options. The buffer size can be reduced to 64 bytes. The latency timer can be set as low as 2ms. A setting of 1ms will cause unnecessary USB traffic and could adversely affect data transmission. Advanced driver options are described in AN_107 Advanced Driver Options.

- **ERRATIC MOUSE POINTER**: The device driver defaults to query an attached device to find out whether it is a mouse or modem, consistent with native COM port operation. Some RS232 peripherals constantly send short packets of data, causing the host system to “think” a mouse or modem has been attached. These short packets will interfere with normal mouse operation causing the pointer to jump around the screen. If this happens, disconnect the RS232 device and uncheck the Serial Enumerator option, also found on the advanced driver options.

- **COM PORT IN USE**: Windows keeps track of all COM port assignments. If multiple FTDIChip products have been connected to a single system, the COM port number will increase, even if the other devices are not attached. If the higher COM port assignments are not acceptable for the application, known unused COM port numbers should be uninstalled.

Distributor and Sales Representatives

Please visit the Sales Network page of the FTDI Web site for the contact details of our distributor(s) and sales representative(s) in your country.

System and equipment manufacturers and designers are responsible to ensure that their systems, and any Future Technology Devices International Ltd (FTDI) devices incorporated in their systems, meet all applicable safety, regulatory and system-level performance requirements. All application-related information in this document (including application descriptions, suggested FTDI devices and other materials) is provided for reference only. While FTDI has taken care to assure it is accurate, this information is subject to customer confirmation, and FTDI disclaims all liability for system designs and for any applications assistance provided by FTDI. Use of FTDI devices in life support and/or safety applications is entirely at the user's risk, and the user agrees to defend, indemnify and hold harmless FTDI from any and all damages, claims, suits or expense resulting from such use. This document is subject to change without notice. No freedom to use patents or other intellectual property rights is implied by the publication of this document. Neither the whole nor any part of the information contained in, or the product described in this document, may be adapted or reproduced in any material or electronic form without the prior written consent of the copyright holder. Future Technology Devices International Ltd, Unit 1, 2 Seaward Place, Centurion Business Park, Glasgow G41 1HH, United Kingdom. Scotland Registered Company Number: SC136640.

<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version 1.0</td>
<td>Initial Release</td>
<td>2009-11-18</td>
</tr>
<tr>
<td>Version 1.1</td>
<td>Updated Part Numbers</td>
<td>2010-02-19</td>
</tr>
<tr>
<td>Version 1.2</td>
<td>Added Figure 2.2 &amp; 2.4; Updated Tables 2.2 &amp; 2.3; Added Note 1 to Table 2.2</td>
<td>2010-06-01</td>
</tr>
<tr>
<td>Version 1.3</td>
<td>Simplified the datasheet contents</td>
<td>2010-11-05</td>
</tr>
<tr>
<td>Version 2.0</td>
<td>Added details on Digital 3.3V and Digital 5V Modules; Edited descriptions</td>
<td>2011-08-31</td>
</tr>
<tr>
<td>Version 2.1</td>
<td>Changed DB9-USB-RS232-M/F name to match the part number: DB9-USB-M/F</td>
<td>2011-10-04</td>
</tr>
<tr>
<td>Version 2.2</td>
<td>Updated Figure 3.1 &amp; 3.2; Added more details to the text reference for Figure 3.1; Corrected the front to back inch measurements and pin to front measurement</td>
<td>2012-06-06</td>
</tr>
<tr>
<td>Version 2.3</td>
<td>Updated Figure 5.1 and contact information</td>
<td>2017-11-07</td>
</tr>
<tr>
<td>Version 2.4</td>
<td>Added UKCA and updated part number to FT232RQ. Added driver support section and updated links.</td>
<td>18-07-2023</td>
</tr>
